

Pushing Rocky Updates to GitHub

Quick reference — GitHub user: [jbragdon21](#) · repo: [rocky](#)

Every time you make a significant code change, do this:

1. Open Git Bash in the Rocky folder

Right-click inside **C:\Users\jbragdon\Desktop\Rocky** and pick **Open Git Bash here**. (Or open Git Bash and run `cd /c/Users/jbragdon/Desktop/Rocky`.)

2. Check what changed

```
git status
```

Look at the list. **STOP** if you see any of these — your `.gitignore` is broken:

- `config.json`
- `Azure ID Info.txt`
- anything in `state/`
- any `.log` or `.jsonl` file

3. Stage everything

```
git add .
```

4. Commit with a short message

```
git commit -m "short description of what you changed"
```

Examples: *"tweak classifier instructions"*, *"fix digest formatting bug"*, *"add new case folder rule"*.

5. Push to GitHub

```
git push
```

That's it. The Rocky laptop will pull the change within 5 minutes and restart automatically.

If git push asks for a password

GitHub no longer accepts your account password on the command line. Use a **Personal Access Token** instead — generate one at github.com/settings/tokens (Tokens (classic) → Generate new token → check the **repo** scope). Paste the token where it asks for a password. Git for Windows will remember it.

One-line version (after you've done it once)

```
git add . && git commit -m "your message" && git push
```
